## Education

**Georgia Institute of Technology** — Atlanta, GA
*Masters of Science in Computer Science* — *Expected May 2028*

**University Of Georgia** — Athens, GA
*Bachelor of Science in Computer Science* — *May 2024*

## Technical Skills

**Languages**: C#, Java,HTML/CSS, SQL
**Frameworks**: Springboot, React, Node, Angular, Blazor, Kafka
**Developer Tools**: Git, Docker, Kubernetes, VS Code, Visual Studio, Github Copilot/CLI, Claude Code
**Certifications:** Associate Google Cloud Engineer, GH Actions 200

## Experience

**Software Engineer** — Jan 2026 – Present
*Charles Schwab* — *Southlake, TX*

- Developed and delivered client-facing features for a full-stack financial planning web application using Angular and Java Spring Boot.
- Designed and shipped a production event-streaming pipeline using Kafka, enabling near-real-time data flow from a backend service to downstream consumers.
- Built and launched RESTful APIs and microservices in Java Spring Boot for a multi-tenant distributed backend.
- Built AI-powered development workflows that automated repetitive team processes, improving engineering efficiency and consistency.
- Developed an automated agent that enforces team engineering standards and workflows, and authored acceptance plans that streamlined production release documentation.

**Software Engineer** — July 2024 – Jan 2026
*402d Software Engineering Group (SWEG) - Robins AFB* — *Warner Robins, GA*

- Designed and developed full-stack cloud applications for the USAF using React, Blazor, C#, .NET, and MongoDB, improving application efficiency by 15% and reducing technical debt for the Air Force.
- Collaborated cross-functionally with stakeholders, engineers, and product teams to align software solutions with DoD security and compliance standards
- Utilized CI/CD pipelines using Docker and Kubernetes, streamlining deployment processes and enhancing system reliability

## Projects

**Fitbit Air - My Whoop Replacement** | *Python, FastAPI, Claude API, SQLite, Google Health API* — 2025

- Built an all-in-one AI training app that replicates the core premium features of Whoop, Strava, and Google Health ([recovery score, strain, sleep coaching, training load, ...]), replacing $378/year in subscriptions for about $5/month in API costs.
- Goes beyond all three with an autonomous Claude agent that reasons across Fitbit biometrics and Strava workouts, remembers goals and past advice across sessions, and texts specific changes to the plan instead of just showing scores.
- Engineered an OAuth 2.0 ETL pipeline unifying both data sources into SQLite behind six agent tools, cut inference to $0.015/query with prompt caching and thinking-budget tuning, and guarded quality with a rubric-scored eval suite and 39 pytest tests.

**Smart TV Cleanup App - Removing Debloat** | *Java · Python · Bash/Powershell · Claude Model* — 2026

- Built a lightweight Java home screen app, styled like Apple TV, that runs smoothly on budget TVs with only 1 GB of memory, supports 31 languages, and now works on 466 TV models from 126 brands.
- Developed Python tools that control TVs over Wi-Fi, scan for hidden tracking like voice listening and viewing monitoring, and back up each TV before making changes, so users can undo everything with one command.
- Designed a fail-safe debloat system that snapshots each TV's state before changing anything and refuses to disable the Home launcher until a replacement is running, preventing bricked interfaces and allowing a one-command restore.
